Category:ASTM standardsQ: Changing a CSS class name in javascript How can I make my javascript find a specific element, change the CSS class name and then put it back again? I've seen examples of how to do it when there is only one class name, but not when there are multiple class names. So if I had I need to be able to find the second and change its CSS class to Another class. Here is what I've got so far. I am currently looking for the second li with the class name mycssclass two. var count = 2; $('li').each(function(){ if($(this).attr('class') =='mycssclass two'){ //Change the CSS class of the second one to classname1 } }); Can anyone help? A: I'd use.hasClass() with the provided selector as the selector: var count = 2; $('li').each(function(){ if($(this).hasClass('mycssclass two')){ //change the CSS class of the second one to classname1 } }); Demo: As an alternative, you can use.toggleClass(), in which case you would do this: var count = 2; $('li').each(function(){ $(this).toggleClass('mycssclass two'); if($(this).hasClass('mycssclass two')){ //change the CSS class of the second one to classname1 } }); Demo: Q: If I compile a.NET framework 1.1 library, will it run 2d92ce491b
