Karaoke might seem all fun and games, but you only need to try it once to realize you actually need a pretty flexible voice in order to deliver a decent performance. Obviously, not all of us are capable of that, and one of the main impediments has to do with what your voice timber allows you to sing. And while you cannot change your voice, you can change the music and make it fit you like a glove. A software utility aimed at precisely that is Keyrite. Comes with support for few audio file formats First of all, it should be pointed out that the setup process you need to go through is nothing to worry about and should not take more than a couple of seconds. Regarding the application's appearance, you may want to know that it is approachable to the point of being modest. In fact, the entire set of features is intuitive and rather limited, with the program being oriented towards one single goal, namely that of changing a track's key. As for how users interact with the app, things are straightforward from beginning to end since you simply need to open your input file and start applying modifications. Note that only two audio file formats are supported, namely WAV and WMA, so you don't really have lots of options. Lets you adjust karaoke song's key On the bright side, before changing your song's key, you can preview it and make sure it sounds as you expect it to. Still, playback options are once again limited, as you can simply play and pause your file as well as adjust its volume. Anyway, what is important is that the application allows you to change a song's key at the mouse click since you simply need to opt for one of the 11 available levels in order to make sure it is pitched neither too high nor too low. All in all, Keyrite is an approachable app you can turn to in order to adjust a karaoke song's key in a matter of seconds. The program sports an unremarkable but intuitive GUI, and its feature set is rather limited, but novices may enjoy it. Read more Realtek 802.11n Wireless N USB
