Simulation AutoCAD has a couple of built-in preconfigured software models for analyzing and simulating systems. There are two preconfigured software packages: SIMULIA Modelica and SIMULIA Mechanical System Analysis (SIMULIA MSA).

SIMULIA Modelica is a system analysis tool for modeling and simulating mechanical, electrical, and pneumatic systems. It can work with any open-source modelica language source code to analyze and simulate physical systems. Modelica is a multi-platform modeling and simulation technology that was originally developed to create mathematical models of physical systems. SIMULIA MSA is a multi-physics, multi-disciplinary analysis tool.

It provides a set of built-in structural analyses based on finite element analysis (FEA) and continuous dynamics analysis (CDA) to simulate deformation, vibration, stability, and failure of structures, enabling a comprehensive analysis of structures from three perspectives. There is a dedicated option in the Workbench for each of the above-mentioned software packages: SIMULIA Modelica, SIMULIA MSA, and SIA (SIMULIA Simulation) for COMSOL Multiphysics. The Massachusetts Institute of Technology (MIT) and MIT Lincoln Laboratory have announced that their team, known as Superbird, has successfully flown a remotely piloted, jet-powered aircraft for four consecutive days and nights, completing as many as 30 flight missions in the process. The team will compete for the \$10,000 grand prize at a NASA-sponsored contest, Space Elevator Games (SEG) 2012. To pull off their feat, Superbird was given access to MIT's electric power plant, capable of delivering electricity to the aircraft's motors. Working together, MIT, Superbird, and the Electric Power Research Institute (EPRI) successfully collected

data and gathered information on the efficiency of various systems, including the vehicle's most important component, its electric motor, as well as the different kinds of batteries used for energy storage and power distribution. By the end of the contest, Superbird's batteries were left with only 30 percent of their charge, but the team was able to charge the batteries back up in order to fly again. The team is still waiting on data from its most important piece, the motor, but if it can beat out the other competitors and win the grand prize, the new technology it has developed could lead to autonomous, jet-powered delivery systems.
